Abstract

Our world is on the brink of a demographic milestone. Driven by remarkable increases in life expectancy, our population is ageing at a fast rate. The people in the age group of 65 or above are projected to reach 1.4 billion by 2030, and that number could reach as much as 3.1 billion by 2050. The traditional systems have failed to resolve the issues of the aged-care sector such as a missing support system, lack of senior homes, chaotic processes, and non-profiling of caretakers.

We at GladAge are building a whole oldage care ecosystem where seniors will be given the best options for personalised care and thoroughly vetted GladAge homes to choose from. More than that the GladAge platform will also provide options for booking a caretaker on demand, shopping for old care equipment and personal care services online and lease land for building Glad-Age Homes.

This ecosystem will be backed by the Blockchain Technology to make the system more efficient, reliable, fast and secure.

This whitepaper presents the core elements of the platform the Ethereum smart contracts which handle the trust-sensitive ownership and reward structures, as well as the detailed specifications of the GladAge platform, online marketplace, and GladAge funds. Finally, we lay out a two-year road-map for launching and scaling the network, some detailed rewards specification, which will play an integral role in its development.

For information on the terms and conditions of the GladAge Token Sale, refer to the Terms and Conditions at our website- **www.GladAge.com**.

Introduction

The world is on the brink of a demographic milestone. Ever since the beginning of recorded history for the first time, the number of people aged 65 or older has been projected to outnumber the population of children aged 5 or less. Factors like plunging fertility rates and noticeable increases in life expectancy are driving our population to age at a faster pace, and it is expected to accelerate even further.

At present, there are an estimated 962 million people aged 60 or over in the world, comprising 13 percent of the world population. The growth rate of people ageing 60 or above is about 3 percent per year. Currently, Europe has the highest percentage of people aged 60 or over (25 percent). All the other parts of the world will face a similar conundrum of accelerated ageing. By the year 2050, except Africa, almost all the areas of the world will have about a quarter or a greater part of their populations at the age of 60 and above.

By 2050, the number of people at or above the age of 80 is expected to triple, from 137 million globally in 2017 to 425 million in 2050. This part of the population is expected to increase upto number of 909 million by 2100 which almost seven times of its value in 2017.

GladAge addresses these issues by using the blockchain technology of Ethereum-based smart contracts and by applying expert industry-savvy tools alongside Specialised local knowledge. We offer GAC tokens, which are unlike other cryptocurrencies as they are not limited to the demand and supply game. With fewer volatility issues, it will be backed by real assets and liquidity in the physical world. The real estate and property assets will be purchased and have value only regarding GAC tokens that bring out the monopoly of the system with advanced use cases. This makes it much valuable and an increasing asset value with time, giving competition to the top 10 cryptocurrencies when covered worldwide.

Industry Stats

174 million people in Europe and North America are aged 65 years or older. This is about 40 million people more than 20 years ago, and a further increase of approximately 93 million people is expected within the next 20 years, which illustrates that population ageing is accelerating.

- The EU together with Switzerland and Norway accommodates more than half of all older persons across the UNECE region. Although being relatively small regarding the surface area, more than 89 million people aged 65 and older live in this part, and almost one-third of them are at least 80 years old. Amongst the six countries with the most significant number of older people in the UNECE region, four nations belong to the EU.

- The share of those aged 80 and older within the total population is rising across countries in the UNECE region.

- The most significant demographic changes are expected within the EU candidate and potential candidate countries. Although this group of countries will still be among those with the lowest share of people aged 80 and older in the total population, the number of people aged 80 and older will double up in the coming 20 years.

Women make up for the majority of the older population, and this case is even more for the population aged 80 and older. As a general rule, the older the age group, the higher the female share of the population which is also reflected by the higher life expectancy of women both at ages 65 and 80.

Among all countries, the Russian Federation has the highest over-representation of women in the age group 65 to 79 (reaching almost 100%). Among those 80 and older, the overrepresentation is highest in Kazakhstan (where the female population is as much as 2.5 times the male population). Differences in life expectancy, as well as gender differences, are important factors in explaining why most beneficiaries in long-term care are often women.

Problems of the aged-care sector

Unorganised Sector

Traditional systems and processes in this industry or domain are very unorganised and not much proper care or methodologies are being followed. This results in deplorable environmental conditions and treatment of seniors making the accessibility of senior care services all the more mentally and physically draining. Non-standardisation allows the rehabilitation centers and NPOs to function according to their wish and will.

No Support System

There are no major support systems available that are well equipped to deal with our ageing population rate. A few NPO institutions are available but they work with insufficient resources, and there is no mechanism present to check their quality of service.

No Scoring System

Non-profiling of caretakers leads to a market phenomenon of 'anything is fine' attitude. Scoring system brings in a competition between the stakeholders and in order to maintain their own prosperity and existence they need to take actions.

Lack of Incentivisation

Lack of incentivisation decelerates progress, innovation and the speed of scaling. When incentivisation is done, it helps to drastically increase the network and the number of brains working together to bring out the best results for the community.

Present market conditions necessitate an immediate acceleration towards the development of a newer and more holistic ecosystem for our seniors. As the demand and supply ratio for senior homes and senior care services is widening, a huge economic change surrounds the aged-care sector. The idea of a population average age of 60 years in the next three decades is a frightening prospect for all of us if the current market conditions are not improved upon.

Ageing Population Rate

Our population is ageing very fast. This shows that there is going to be a dire need for a support system to take care of the senior population and a huge economy can revolve around it.

Lack of Senior Homes

There is a massive gap of care homes available and the number of care homes needed. Even the ones that are available are not fit for purpose and lack the desired standards of living to provide a homely atmosphere.

Living Arrangements

Research says that older people aged 65 to 79 tend to live as a couple, in contrast to the general population, where households with more people, with children or other constellations, are the dominant living arrangement. Nevertheless, a third of those aged 65 to 79 in Bulgaria and Spain still live in larger households with more than two persons and children. On the contrary, this household type is almost non-existent within the 65 to 79 age group in Northern European countries such as Finland, the Netherlands, Norway, and Sweden.

Living arrangements of the oldest old (i.e., 80 and older) also show a clear South-North divide. While most people in this age group live on their own in the Nordic countries (between 57 to 67%), this is less common in Southern European countries such as Cyprus, Greece, Portugal and Spain.

According to the research data, one possible and plausible hypothesis for the differences in the number of older people living in private households and institutions is the availability of care services at home. In countries where home care services are scarce, older people in need of care may find themselves in institutional care. Thus, the share of older people living alone may also display differences between care regimes.

Social Connections

Lack of social contact with the older population (aged 65 or over) ranges from 3-4% (the Netherlands, Denmark) to over 40% (Greece, Hungary). In 11 out of 26 countries, at least one out of five older persons is affected by social isolation.

- In some countries such as Cyprus, Greece, and Hungary, 10% or more of the older population say that they never meet friends, relatives or colleagues. This extreme degree of isolation is likely to have a negative impact on health and well-being and may aggravate the need for public long-term care solutions.
- Social isolation increases with age and is even more prevalent among the population aged 80 or over in all countries. In Cyprus, Estonia, Greece, Hungary, and Poland over 40% of those aged 80 or older are affected by non-existing or infrequent social contacts.
- Lack of emotional support, measured by the lack of anyone to discuss personal matters with, affects more than 1 out of 10 old-age persons in the majority of countries and reaches 25% in the Czech Republic and Slovakia.
- The two indicators of social isolation highlight different facets of social isolation 9% of older people are isolated regarding rare meetings and equally 9% are affected by having no one to discuss personal matters with, only 3% are affected by both of these, suggesting a limited overlap between the two measures.

Solution

The sole purpose of GladAge is to create a senior citizen-friendly atmosphere with all the necessary care at their service. Our platform will provide anything and everything from personalised care, thoroughly vetted GladAge homes, elderly care equipment, caretaker on demand to personal care services online. Our system is Ethereum-based; Blockchain Technology provides a greater advantage in terms of effectiveness and efficiency to perform actions in an organized manner.

The following are the modules inside the ecosystem

GladAge Homes

GladAge Homes will open up opportunities for landlords and property owners to create a source of revenue by leasing out their properties to government or social ventures. This will create a Glad economy for the landlords completely backed by a cryptocurrency and smart contracts to help ease governance. The smart contracts will provide complete interoperability between two stakeholders in the legal, accounts, validation and verification processes.

GladAge Homes platform will provide the following functionalities :

- Leasing land for construction of GladAge Homes using the GladAge fund.
- Leasing an already built infrastructure for refurbishment according to GladAge Home's standards or for direct use if it already meets the standards.

GladAge platform will forge a rental process for the long-term with Blockchain Technology and smart contracts. This process will comprise of all the rental tasks in one place, making things easier for tenants as well as the landlords. These tasks will include:

- Searching for properties
- Making offers/bids via the GladAge auctioning platform
- Screening prospects
- Selecting the best/most suitable candidates
- Negotiating the terms
- Unlocking rental security deposits
- E-signing contracts
- Paying rent
- Submitting maintenance requests
- Hiring third-party service providers for maintenance services (e.g., handyman and plumbers)
- Enabling family members to stay connected with GladAge home tenants.

Fully Vetted GladAge Homes

We believe it is our obligation to take care of our seniors. Therefore, to provide senior residents with the most appropriate standards of living, GladAge homes will be built in conformity with our high standards. They will come equipped with all the necessary technology and hospitality arrangements including - daily assistance with activities, social engagement, an e-commerce platform for shopping, and on-demand 24x7 personalised care options to ensure that our seniors always feel at 'home.'

Age-Friendly Homes

GladAge Homes will be designed in an age-friendly manner to provide utmost comfort to our residents. Some of these design innovations will include - chamfered wall-edges, anti-skid tiles, emergency-care switches, and so on.

Safe & Secure

To ensure that our residents always feel secure about their lives and their belongings, all GladAge Homes will be kept under constant surveillance through CCTV and will be guarded by trained security professionals. Further, there will be the provision of Emergency response systems (EMR) and on-call doctors to attend to any discomfort or emergency that our residents may face.

Hassle free living

Seniors will be provided easy access to maintenance services (handyman, plumbers), convenience stores and medical camps.

Social Engagement

To address the issue of social isolation, GladAge Homes will provide necessary arrangements for seniors to connect with other similarly aged-people to have one-on-one interactions or get-togethers to celebrate an occasion, or to engage in conversations.

Assisted living

GladAge Homes will have trained professional caretakers available on-demand to assist seniors with daily living activities such as walking, grooming, and assistance in meals or to provide companionship or help in commuting.

Active lifestyle

Seniors will have the options to attend classes on yoga, cooking, dancing, and art-therapy. Seniors can also engage in various sports, or the active readers can visit libraries. There will also be a provision of meditation and devotional sessions for the spiritually inclined.

Interface for Next of Kin

Medical records of seniors will be stored digitally and made available to the next of kin through GladAge's website to keep them updated on their parents' health, fitness progress and their involvement with GladAge.

Personalised Care Services

On-demand Personalised Care Services

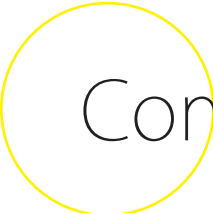

The GladAge platform will provide seniors an affordable way to find highly qualified in-home caretakers for the provision of personalised care services (non-medical). To ensure the highest delivery of satisfaction, all caretakers on the GladAge platform will undergo various screening and training tests. Our feedback system will allow seniors to provide further feedback and rate the quality of services received. Payment for these services will be made using GAC Coins through Smart Contracts for convenience, reliability, transparency and complete auditability.

Personalised care services on the GladAge platform will include

- 24x7 personal care assistants
- Transportation
- Shopping
- Meal preparation
- Companionship

Fully Trained Caretakers

To make sure that our elderlies get the highest quality of service, caretakers at GladAge Homes will be screened carefully and will undergo thorough professional training on the basics of geriatric care, health, hygiene, incident/emergency management skills and soft skills. This training will allow the caretakers to effectively handle various kinds of behaviour issues in seniors, assist seniors in activities such as walking, jogging, and grooming to organizing parties to keep residents positive and happy. Caretakers will also be trained to pick up on the body-language of residents to know if they are hungry, irritated, anxious or going through any health problem.

Commerce Platform

An E-commerce Store For All Elderly Needs

Our e-commerce platform will provide our residents easy and hassle-free accessibility to eldercare products and equipment suited to their needs from the comfort of their homes.

The GladAge commerce platform will also enable the ecosystem to trade different assets and art forms. The listings will consist of lands for lease, homes available for refurbishment, medicines, tools, healthcare equipment, and many other utility tools for elderly people will be listed on the platform. The assets listed on the platform will consist of both new and used assets which can be sorted in the marketplace.

The marketplace will have options like

- Purchase of medicines.
- Elderly care goods and equipment.
- Free listing of land for leasing purposes
- Donation and Auctions of goods and items.
- Rent personal care services.

Scoring Mechanism

Matching Algorithm

We at GladAge have developed an advanced matching algorithm to provide the best and suitable recommendations for any senior person based on specific parameters like distance, rating, skills, certifications, language, experience, availability, gender, etc., making the whole process extremely cost-effective and efficient just like Uber for caretakers.

Algorithm Formula

[(distance * .27) + (punctuality * .16) + (rating * .13) + (skills * .10) + (certifications * .07) + (language * .05) + (acceptance * .05) + (experience + .04) + (response * .04) + (availability * .03) + (earnings * .02) + (newness * .02) + (references * .02)] * (gender)

Formula

$$\sum_{i=0}^n f(i) \times G \times \frac{P_q}{P_c}$$

Here,
f(i) is Initial Voting Confidence Score
G is Constant
P_q is the Quoted Price
P_c is the Current Price

Support modules

Here are few of the proposed possible models for GladAge

- **Government Aids and Grants**

The GladAge foundation will join hands with the local governments to create maximum impact. GladAge would work in tandem with the governments of the land to facilitate distribution and utilization of grants and aids. Also, the foundation would lease government lands to create infrastructure making it a win-win situation for all stakeholders. This would be a PPP (Public Private Partnership) model where we will try to avail the financing needs from the government. Another possibility is investing money into the GladAge project from the pension fund by the government.

- **Corporate Social Responsibilities**

Many large corporations donate a percentage of their total profits towards societal benefits under a scheme popularly known as Corporate Social Responsibilities. The foundation would actively engage such corporations and try to secure donations for GladAge.

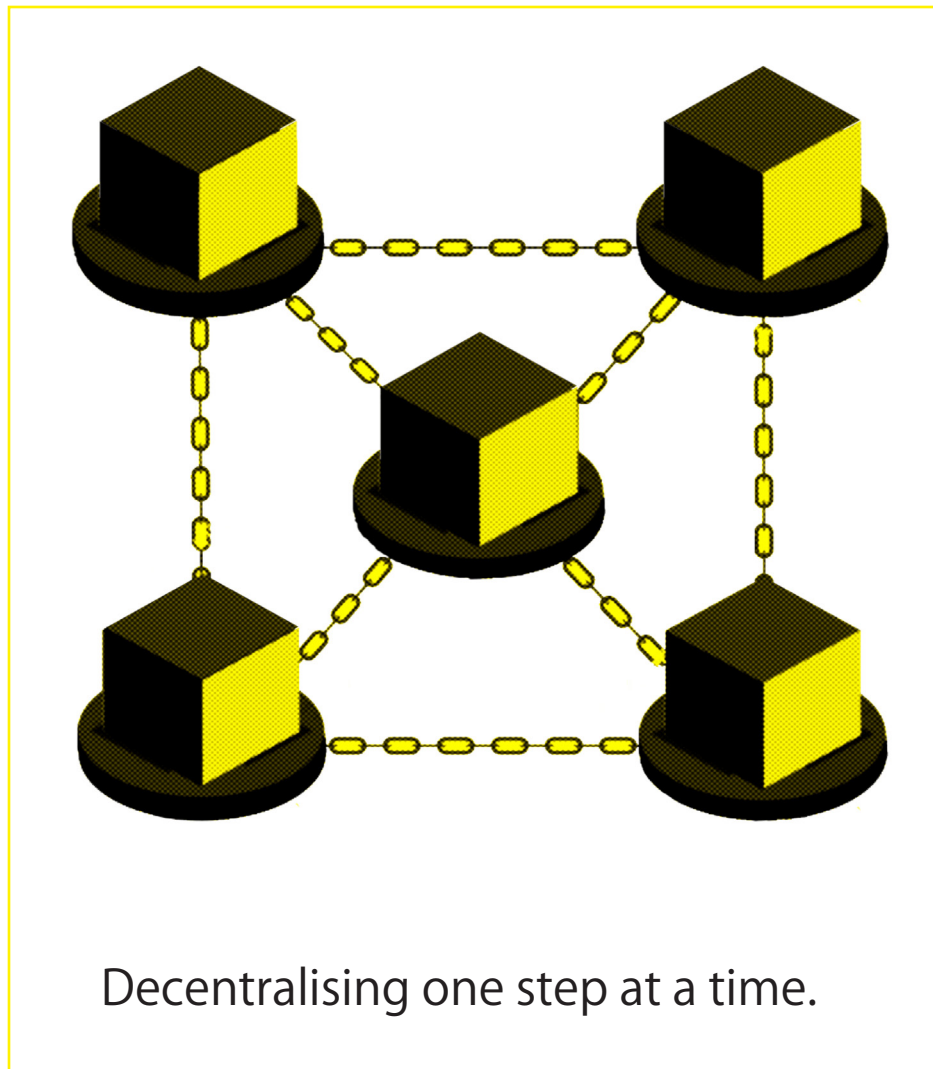

- **NPOs**

There are several social Organisations and NPOs operating in the senior domain who are willing to engage, solve operational challenges and guide us through the journey. Some of the NPOs also have spare properties which can be turned into GladAge homes.

- **Services Trading**

The seniors can offer multiple services like consultancy, advisory, etc. to companies and Organisations using our services platform. The seniors are people with an abundance of knowledge, expertise and experience diverse fields. A service-trading platform would help them trade their skill and service directly to our partner corporates & NPOs. These transactions would take place using our token thus triggering more volume usage for the GAC coin.

Technology

Ethereum Blockchain

The core GladAge protocol is decentralised using smart contracts running on the Ethereum Virtual Machine (EVM). Ethereum is a programmable blockchain which can run small units of code called smart contracts. A “blockchain” in general is a peer-to-peer network where every member (node) holds the same copy of a shared record or database, which can’t be defrauded.

Blockchains has proven worthwhile in trust-imperative cases. It is highly useful in cases where a central authority controlling an institution can lead to a conflict of interest and also risks exploitation of users. Blockchain’s proof-of-work feature makes it possible to add new entries only by solving mathematical problems, which in turn provides a cryptographic proof that a particular computer has solved a puzzle. Whenever this happens, that particular computer or node is permitted to add a predefined number of transactions to a ‘block.’ This block is then affixed to the blockchain, with one block making the record higher. This is also where Ethereum comes in with “Turing-Complete” scripting language known as Solidity, which can be used to compile into EVM opcodes. This language makes ledger-based blockchain technology a lot more functional.

Senior Home Utility Systems

For smooth operations and governance, there need to be systems ready for Organisations to be able to run them properly. The ERM solutions and applications that will be required for various processes in between the networks of 3 layered architecture is readily available open source on the utility systems.

SH Utility Systems will have following built-in modules

- Organisation accounting
- Fund balancer
- Pension Plans
- Insurance schemes
- User Profiling
- Leasing
- Block Ledger
- Peer to Peer wallet
- Client POS
- Renting
- Property Licensing

Ethereum Swarm

Swarm is a distributed storage platform and content distribution service, a native base layer service of the ethereum Web3 stack. The primary objective of Swarm is to provide a sufficiently decentralised and redundant store of Ethereum's public record, in particular, to store and distribute dapp code and data as well as blockchain data.

Taking an economic viewpoint, Swarm allows all the participants to pool their resources for storage and bandwidth. This provides all the aforesaid services to every participant.

These objectives have the following composition requirements:

- Assigned storage, inclusivity, long tail of the power law
- Adjustable expansion of space without any hardware investment decisions, unrestrained growth zero downtime
- Unchangeable, verifiable but possibly deniable storage
- Zero points of failure, resilience to fault and attack
- Censorship resistance, universally accessible permanent public record
- Viability due to an incentive system
- Efficient market-driven pricing, a tradeable trade-off of memory, persistent storage
- Efficient use of the blockchain by the swarm accounting protocol
- Deposit-challenge based guaranteed storage [planned for POC 0.4 by Q2 2018]

ERC23

The ERC23 standard is a new, backward compatible, token format designed to solve some of the existing issues of ERC20, such as

- Handling of incoming transactions from the receiver contract
- Ensuring that transactions for one token will not be received by the receiving contract of another token
- Ensuring uniformity within Ethereum such that the `transfer()` function is called for both contract and account deposits.

While compatible with ERC20 standards, the Token also implements the more robust ERC23 token interface.

ERC 23

GladAge Token Sale

Token Economics

We propose to organize an Token Sale to realize our vision and create a GAC token for use on the GladAge platform and in the GladAge Marketplace. The Token Sale of GladAge and the corresponding GAC coin generation are organized around smart contracts running on Ethereum. Anyone wishing to support the buildup of the GladAge platform can be a part of the development by merely sending Ether to the address we designate. By doing so, they create GladAge Tokens (named GAC) at the rate of 10,000 GAC per 1 Ether (ETH), considering the price of 1 ETH at \$1000. A participant must send Ether to the account after the start of the GAC period (specified as the block number). GAC ends when the end block is created, or when the amount of Ether sent to the account reaches the maximum.

The GladAge smart contract conforms to a few essential rules

- Before the Token Sale starts, no Ether can be sent to the GladAge smart contract
- After the Token Sale (either maxCap was reached or the GAC deadline passed), no Ether can be sent to the contract
- During the GladAge Token Sale, participants simply send ether to the GladAge contract which results in GAC (GladAge coin) creation
- All created tokens are locked during the GAC Token Sale

There is no minimum financing specified in the contract code. If minimum financing is not reached, then after the GAC period, Ether is sent back to the participants from the GladAge account. Because GAC is locked by default if minimum financing is not reached then Ether return procedure is simple and straightforward. Participants should note this and take necessary precautions.

The Token Generation Event leads to the creation of GAC, a backbone token for the GladAge Platform. GAC implementation follows widely adopted token implementation standards.

Migration is to be used if it turns out at some point that token upgrade is needed for whatever reason (e.g., changes in Ethereum, or changes in GladAge's design). The upgrade will need action from token holders and cannot be imposed by GladAge Platform.

GAC summary

GAC tokens created per 1 Ether	10 000 GAC
Minimum Ether*	2000 ETH
Maximum Ether	20000 ETH
% of tokens generated to the GAC Team	12%
Approximate date of start (StartBlock)	20th March
Approximate date of end (EndBlock)	28th June
Minimum number of GAC generated	10 000 000 GAC
Maximum number of GAC generated	500 000 000 GAC
No. of GAC for tokensale	200 000 000 GAC
No. of GAC for Team & Advisors	110 000 000 GAC

*Minimum financing is not implemented in the GAC smart contract. If minimum financing is not reached, refunds will be implemented by a separate contract.

*10,000 GAC per 1 Ether (ETH), considering the price of 1 ETH at \$1000.

Usage of Token Inside the system

The GAC tokens generated during the Token Sale can be used for the following activities inside the system

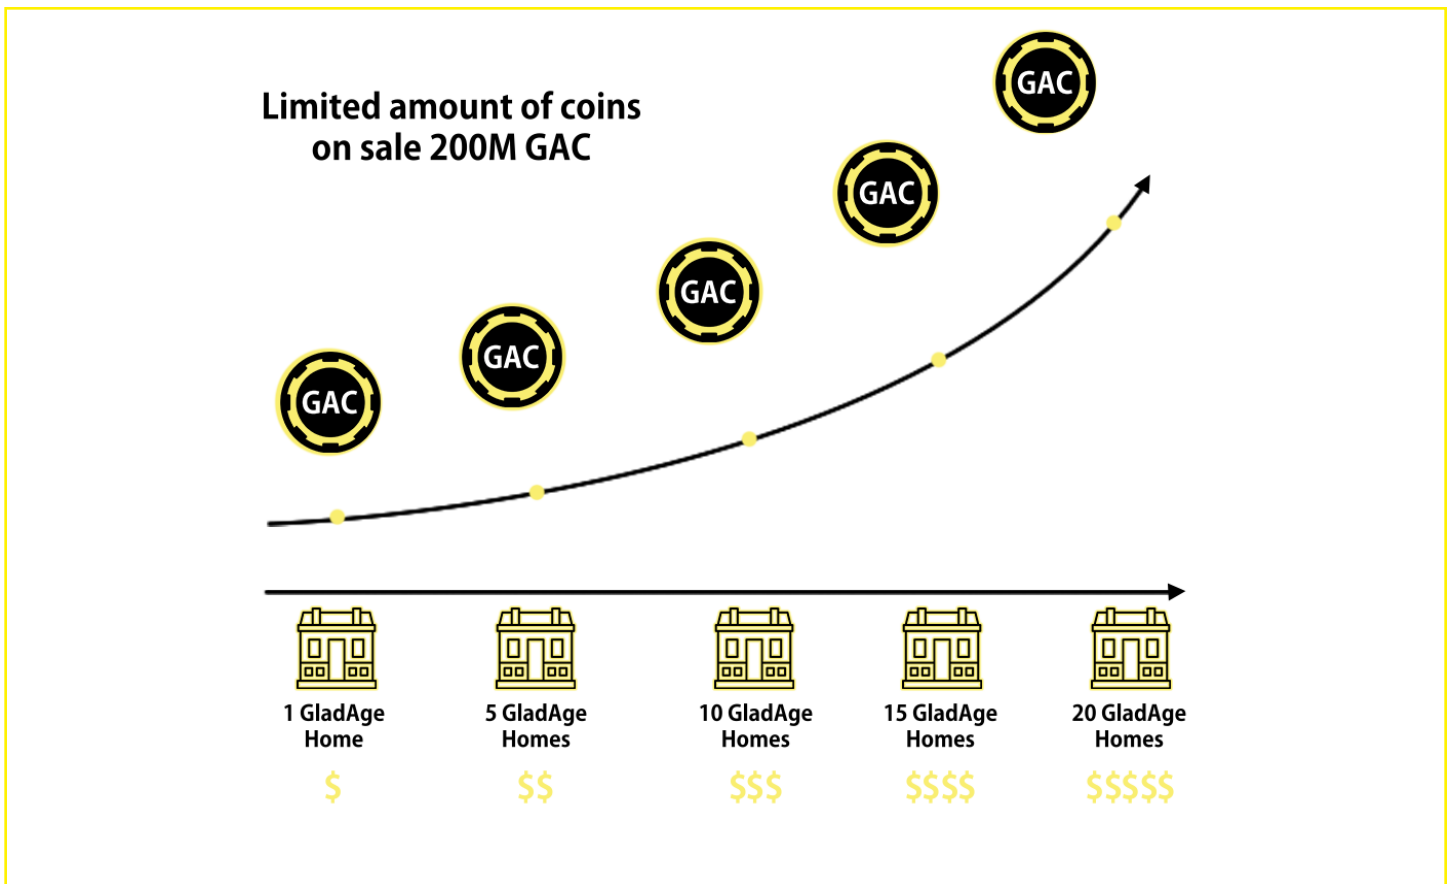

- Buying and selling of GladAge Homes
- Leasing of land and used infrastructure for refurbishment
- Buying and selling of goods and items inside our e-commerce marketplace
- Paying monthly or yearly premiums for insurance
- Transactions or activities related to smart systems
- Payments for on-demand services in 'GladAge Caretakers' platform
- Booking of CareTakers
- Payouts to CareTakers

Revenue Model

GAC tokens are backed with a solid revenue model. Many day-to-day activities of GladAge offer regular revenue streams for the system, as listed here-

- The commission's from the rental platform for old age homes
- A commission fee charged on anything and everything that is bought or sold in the e-commerce platform adds to the revenue of GAC tokens.
- GladAge offers affordable personalised care services for all in-house members which are to be paid for with GAC tokens only.
- At Glad Age, elderlies with vast experiences are given an opportunity to offer a variety of services. Subscriptions and payments to each on-demand service will, in turn, generate another regular source of income.

Growth Speculation

Token Distribution

Total number of Tokens 500 Million

Tokens Allocated To:	Percentage	Number of Token
Investors	40%	200 M
Bounty	8%	40M
Bonus	15%	75M
Team	12%	60M
Advisors	10%	50M
Contingency	3%	15M
Foundation Holdings	12%	60M

Pre-Sale

GladAge will hold a 'presale' to ensure that all our early supporters and contributors with a genuine and deep interest in our interactive platform, vision, and mission, deemed important to our success can get tokens before anyone else via the Token Sale.

All participants in our Pre-Sale will receive an additional 25% of tokens on top of their contribution as a sign of our recognition of their trust and commitment. Contributors who wish to participate in the Pre-Sale can register on our website www.GladAge.com to indicate their interest.

GAC Tokens to be created per 1 Ether in the GAC smart contract	12 500 GAC
Minimum Ether per Presale contribution*	\$1000 worth ETH
Maximum Ether allowed in Pre-Sale smart contract	8000 ETH
Approximate date of start PreSale	1st May
Approximate date of end PreSale	30th May

GladAge Bounty Programme

As a special incentive, GAC Bounty has been created as a reward for participants who experience and/or promote GAC Coin before the crowdsale.

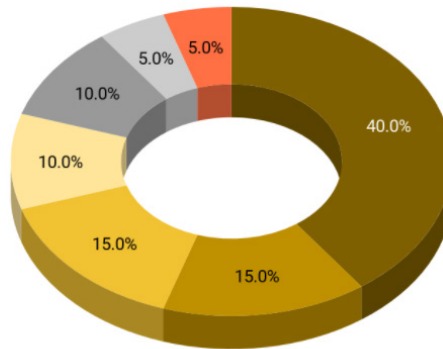

8% of the total supply of GladAge has been set aside for community bounties. The community is invited to earn a proportion of this bounty by promoting our Token Sale process.

Participants will be allocated a specific amount of GladAge Bounty (GACB) for promoting GAC coin on blogs, tweets, and other social media as well as for participating in our tech demo. Participants will share 8% of tokens pro rata based on the total of GACB they have earned.

Usage of Funds

GladAge will use the fund raised during the Token Sale as per its proposed product roadmap. The expense structure has been mentioned in detail below

● Old Age Homes Setup ● Technology Development ● Operational ● Marketing
● Team ● Legal & Finance ● Contingency

Old Age Homes Setup

A major allocation of the raised funds will go to creation of old age homes at the proposed locations. Initial setup includes renovating and equipping the facilities to ensure the comfort of the seniors.

Technology Development

Technology development will include building upon and securing core smart contracts, setting up additional frameworks such as databases, trading and management interfaces and integrations with future Ethereum infrastructure.

Operational Costs

Operational Costs include setups in multiple locations, running the day to day operations and operating expenses of the Organisation.

Marketing costs

Marketing costs would be incurred towards onboarding more users and increasing the reach of the product in general in the market.

Legal & Financial costs

To ensure everything is done in accordance with the laws of the land and complete financial transparency is maintained by regular audits we plan to engage best in class firms.

Consultants & Team

To honor the valuable time and expertise of the team & consultants involved they would be compensated as per their contributions. The company would make sure of unbiased distribution of the compensation.

Roadmap

Our Team

SUNNY KAPOOR

Chief Executive Officer

- Founder and owner of Heat Lodge Care Services Ltd
- 20-years of experience and in-depth knowledge of the care sector

SHANE RUSHENT

Chief Technical Officer

- CEO of a Tech company with over 10 years of experience
- He is known for turning new opportunities and niches into successful businesses

REAVEN D'SOUZA

Chief Marketing Officer

- Founder and Managing Editor of The Times Kuwait, a well-respected widely & circulated weekly publication in Kuwait
- Over 25 years in print & online media

MUKUL JAIN

Chief Strategy Officer

- BS in ME from NDSU
- Graduate from Harvard University
- Active MIT Bitcoin Club Member and Certified Blockchain Professional at IIEC

KEN HUANG

Security Architect

- Founder and CEO of Distributed Blockchain Applications
- Administers technical and strategic assistance focused on distributed businesses based on Blockchain

DANIEL BIESUZ

Chief Legal Officer

- 13-Years experience in legal work, asset management and structuring of transactions
- Specialised on Decentralized Ecosystem, ICOs and Fintech in general

EVAN LUTHRA

Strategy Advisor

- A 'Top 30 under 30' Entrepreneur
- Serial Entrepreneur & an accredited Angel Investor
- At a young age of 22, he already has been actively working with global crypto players

KARAN KOHLI

Blockchain Architect

- Ninja Level coder
- Specialist In Blockchain development space
- CTO & CO-Founder at almora.io

SIDDHARTH ARMAAN SHARMA

Investments Advisor

- A visionary entrepreneur
- CEO of OceanCapital
- Strong knack for picking up great ICOs

ANAT MALKIN

Growth Strategist

- Hospitality Industry Expert
- Graduate of IIM-Pusa
- Business leader and a respected social figure amongst the Indian community in Kuwait

VISHAL BHARDWAJ

Australia Investor Relations

- 20-years of experience in Logistics
- A multi-passionate entrepreneur in the automotive industry from Australia

NEERAJ SONI

Full Stack Developer

- Worked on E-Commerce web apps, CRM modules and various tech products
- Proficient in multiple programming languages and technologies

JITENDRA THAWANI

Business Analyst

- Blockchain expert with extraordinary trading skills
- Handled investor connection in China

KASHIF SYED

Community Manager

- Experienced in building and managing the crypto and blockchain communities
- Involved in leading communities for GazeCoin, Cashaa and LiveTree

YASH JEJANI

Business Consultant

- Leads the operations at Almora.io
- Proficient in multiple Worked with Healthtech, Cleantech, Telematics and SAAS

DANNY WIRKEN

Advisor

- 25-years experience in the IT&T business, Data centre construction and management
- In-depth knowledge of IT, Cloud service & Cryptocurrencies, Financial & Strategic planning

SHMUEL KANER

Advisor

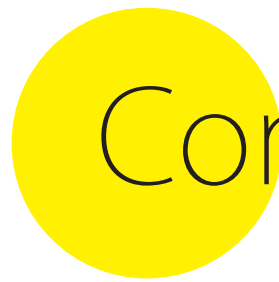

- Successful business owner of a UK-based property business, with over 20 years of experience within the property and estate management industry

SHIVA KARAN

Project Manager

- Expert in Sustainable development
- Worked with Malaysian Ministry of Finance

Conclusion

GladAge platform has been created with the singular purpose of serving the elderly population, who are often left alone when they need the assistance. Blockchain technology is bringing about tremendous changes in various industries, and we want to use the technology for the betterment of the society. Everything will be connected and tokenised with blockchain in the coming future, and we believe in staying ahead of the line.

We worked hard at coming up with an idea based on blockchain that leads to the more substantial scalability of an industry, and elderly care home was the issue closest to our hearts. GladAge aims at replacing conventional senior citizen homes with technologically-forward homes that give the best care to our elderly. All our energies and efforts will be directed at achieving this with the utmost care. With your cooperation, we hope to be doing what we set off to do in the most satisfying sense of the word.
